Project : Passwordless Authentication by FIDO2

In this project, I would like to continually doing from previous Bachelor degree project but doing in other mode. Passwordless Authentication project is about how do you login in some websites by not using password anymore. However, I don't care much on performance because I assume that user can wait for response.

Project : Food Kingdom

This idea came from my pain point about we can not decide what should we eat for dinner or lunch. Basically, this software just randomizes some food menus and recommend it for us.

Thus, I don't care much about security but I care about availability and performance because if I need to use it, I would like to get the result now.

Security	Scalability	Availability	Performance	Testability

Project : AIT-Chana

During Covid-19 situation, it would be useful when we know those timelines for each other. This software basically like tracking and informed application.

The key things that we have to concern are scalability and availability.
